

1. What is your name?

Brock Francom

2. The following definition and note appear on our agenda for Meeting #9; in light of the definition, write a paragraph that explains why you agree with the note or why you disagree with the note:

Measurements

Definition for *measurement*: A measurement is a process by which data or information are collected via empirical observations.

Note: A measurement is an objective process focusing on a quantitative variable.

I agree with the note, because this makes it very clear what can be measured. Height, Time of fall, number of Heads in a coin flip, etc. are things that can be measured. This is something that could be easily programmed and executed by a computer.

3. The following definition and note appear on our agenda for Meeting #9; in light of the definition, write a paragraph that explains why you agree with the note or why you disagree with the note:

Assessments

Definition for *assessment*: An assessment is a judgment or evaluation drawn from inferences that extend beyond what has been empirically observed.

Note: An assessment is a subjective process focusing on a qualitative variable.

I agree with the note. This makes it clear what needs to be assessed. For example, happiness, sadness, relationship satisfaction, etc. are examples of things that should be assessed. This needs humans to determine happy or not, etc. It requires Judgment

4. Smile.
