Homework 1

My experiment will test how many families in the apartment complex next to my house will move out within the next year.

I would survey a random sample of married people at USU and ask them the amount of time lived in their last apartment. Then I would find the average amount of time a family lives in a college apartment. I would note how long each family has been living in the complex next to my house, and then use that data to predict how many people would move out in the last year.
